

Research Opportunity for Adolescents and Adults with ASD

Currently, there are no approved treatments specifically for autism spectrum disorder (ASD). That's why we need your help. We are enrolling adolescents and young adults with ASD **ages 13 through 30** to participate in a study at Southwest Autism Research & Resource Center. The purpose of this research is to determine the effectiveness of an investigational medication in improving the most common behavioral symptoms of ASD.

About the Study

- This study is a double-blind trial meaning that half of the participants receive the active medication and half receive a tablet with no active medication.
- Over 16 weeks, there will be 8 study visits at SARRC's Research Center. Adults and caregivers will receive reimbursement for their time and travel. Study related medical exams, ASD assessments, and the study medication will be provided at no cost to families.
- Eye-tracking and other bio-metric data will be collected which may provide a robust way to determine possible effectiveness of the investigational medication.
- Parents or caregivers will track several behaviors through an online portal that can be easily accessed through their smart phone or computer.
